

Maxime Delhaye

1348, Louvain-la-Neuve Belgium | +32 470 35 44 52

maxime.delhaye.md@gmail.com

I am Maxime Delhaye, a student at UCLouvain in Civil Engineering (Computer Science Specialization) and passionate about programming since I was 12 years old. I specialize in low-level programming (C). My approach is guided by performance and security, as close to the machine as possible. I value the elegance, readability, and scalability of my code to ensure efficient maintenance and effective teamwork, even on complex systems. I have experience in personal projects involving interoperability and cross-compilation to enable usability by developers from all backgrounds.

Accomplishments

Created a ultra-lightweight, secure, no-sandbox, LLM-to-machine bridge in C
(github.com/friphazeph/llinal)

(In development) static transpiler from iNES to ELF64 in C/fasm

Skills

C programming

Algorithm design

Data-oriented design

Work History

C+Python Developer for LLM (AI) integrations

ProofPilot

- System & Security Pole (C): Designed an intermediate language: Developed a low-level communication layer for LLM 'tool use'. The architecture allows secure execution of machine commands without any need for software isolation (sandboxing), ensuring maximum performance.
- Agent orchestration: Created an internal API (Python) for controlling specialized agents based on this infrastructure for AI integration into an onboarding system.
- Data & RAG Pole (Python): Retrieval Augmented Generation (RAG) Architecture: Implemented a retrieval augmented generation system connected via API to Dropbox environments for exploiting remote cloud data.
